

Injectable Non-Fillers:

Botox®: BOTOX® is a highly effective, safe, FDA approved nonsurgical procedure that can dramatically reduce the appearance of the toughest wrinkles including frown lines between the brows, crows feet and forehead lines. Injections of BOTOX® into facial muscles block the chemicals that signal muscle contraction and relaxes the overlying skin and soft tissue. Results are first seen in three to seven days after injection and can last from three to six months. No recovery time is needed. With regular reapplication the results begin to last longer, especially if treatments are done before the muscles are allowed to return to full strength.

Dysport®: Dysport® is also an FDA approved botulism toxin injection used for cosmetic procedures. The mechanism of action is similar to Botox® as are the treatment indications as discussed above. Clinical studies of Dysport® have demonstrated a faster onset of wrinkle relaxation with an average of two to five days and a longer lasting effect, close to six months. Dysport is an alternative to Botox injectables.
