

Sclerotherapy:

Did you ever believe you could be free from unsightly spider veins and painful varicose veins--safely, painlessly, and without surgery? Sclerotherapy was brought to the U.S. from Europe more than 40 years ago and continues to be the gold standard of treatments. Whatever the cause – age, genetics, pregnancy or hormonal changes – sclerotherapy successfully removes small, unappealing leg veins. The procedure is performed in the office where an evaluation of the area is performed. Using a very fine needle, the spider veins will be injected with a sclerosing fluid. Over the next several weeks, this fluid causes the vein to collapse and the blood to be reabsorbed into the body leaving you with beautiful skin and no spider vein. Several sclerotherapy treatments are required to achieve optimal results. After the procedure, you may resume your usual activity and return to visit us in a few weeks.
